Velmora: Three changes before Black Friday

GIS Analytics assessment · October 2026

What the numbers say

Across April to September 2026, the shop had 31,667 sessions, 239 orders and £80,440 of revenue. The average order was about £337. 79% of sessions are on a phone.

Phones convert at 0.43%, desktop at 1.98%. People add to cart at the same rate on both (5.6%), so they want the clothes. The loss is at checkout: 14% of mobile checkouts finish, against 57% on desktop.

1. Fix mobile checkout

Why. 755 mobile checkouts were started and 109 finished. Every extra 10 points of completion is about 75 orders over six months, or about 12 a month (about £4,200).

What. Show the delivery date, delivery cost and returns policy before payment. Turn on Apple Pay, Google Pay and Shop Pay, and allow guest checkout. First, watch real mobile checkouts to find the cause, because the data does not say which of these it is.

Measure. Mobile checkout completion (orders ÷ checkouts started), weekly. Now 14%. Target 25%, since mobile visitors arriving direct already reach 27%.

2. Pause paid social until checkout is fixed

Why. The August and September test spent £2,700 and brought 10 orders and £3,376 of revenue: £270 of ad spend per order. At a 55% margin that revenue is about £1,857 of gross profit, so the test lost about £840. It needed £1.82 of revenue per £1 spent to break even and made £1.25. Only 7% of its checkouts finished.

What. Pause it. Restart small after change 1, sending people to occasion pages that show delivery dates.

Measure. Gross profit after ad spend (revenue × 55% − spend), weekly. Restart at full budget only if revenue per £1 spent stays at £1.80 or more for two weeks.

3. Collect emails with an order-by date

Why. Email converts at 2.98% and 81% of its checkouts finish, the best of any channel, but it brought only 1,744 sessions. Instagram brings 59% of sessions and converts at 0.47%.

What. Offer to email each visitor the order-by date for their event, with their consent, and use the list for a Black Friday early-access email. Be plain about timing: a made-to-order piece bought on Black Friday (27 November) takes up to 21 days to make plus up to 5 days UK delivery, so it arrives by 23 December at the latest. Promote the 9 ready-to-ship pieces for Christmas.

Measure. Email sign-ups per week. Email orders and revenue per month, against about 9 orders and £2,850 a month now.

Watch-outs

- The studio makes at most 20 made-to-order pieces a week, about 120 before Christmas. Stop selling made-to-order slots beyond that.
- There are no reviews yet. Show none, and do not invent any.
- The uplift figures are estimates from six months of data, not promises. I would check them after two weeks.
